## 1 Theorem: Derivative of Inverse Functions

Let  $f(x)$  be invertible and continuous in an open interval about  $x_0$ . If  $\exists f'(x_0) \neq 0$ , then, the inverse function  $x = g(y)$  is differentiable at  $y = f(x_0)$  and

$$g'(y_0) = \frac{1}{f'(x_0)}$$

### 1.1 Examples

#### 1.1.1 Example 1

$$\begin{aligned} y &= f(x) = \tan x \\ \therefore (\tan^{-1})'y &= \frac{1}{\tan' x} \\ &= \frac{1}{\frac{1}{\cos^2 x}} \\ &= \frac{1}{1 + \tan^2 x} \\ &= \frac{1}{1 + y^2} \end{aligned}$$

Similarly,

$$(\cot^{-1})'x = -\frac{1}{1 + x^2}$$

## 2 Chain Rule

Let  $y = f(u)$  be differentiable at  $u_0$ , and  $u = g(x)$  be differentiable at  $x_0$ , s.t.  $u_0 = g(x_0)$ . Then,  $y = f(g(x))$  is differentiable at  $x_0$ , and,

$$y'(x_0) = f'(u_0) \cdot g'(x_0)$$

### 2.1 Proof

$$g'(x_0) = \lim_{\Delta x \rightarrow 0} \frac{\Delta u}{\Delta x}$$

Therefore, by Theorem 2,

$$\begin{aligned} \therefore \frac{\Delta u}{\Delta x} &= g'(x_0) + \alpha_1(\Delta x); \alpha_1(\Delta x) \rightarrow 0 \text{ if } \Delta x \rightarrow 0 \\ \therefore \frac{\Delta y}{\Delta u} &= f'(u_0) + \alpha_2(\Delta u); \alpha_2(\Delta u) \rightarrow 0 \text{ if } \Delta u \rightarrow 0 \end{aligned}$$

Therefore,

$$\begin{aligned}
\Delta u &= (g'(x_0) + \alpha_1)\Delta x \\
\Delta y &= (f'(u_0) + \alpha_2)\Delta u \\
\therefore \Delta y &= (f'(u_0) + \alpha_2)(g'(x_0) + \alpha_1)\Delta x \\
\therefore \frac{\Delta y}{\Delta x} &= (f'(u_0) + \alpha_2)(g'(x_0) + \alpha_1)
\end{aligned}$$

$$\begin{aligned}
\Delta x \rightarrow 0 &\Rightarrow \Delta u \rightarrow 0, \alpha_1 \rightarrow 0 \\
&\Rightarrow \alpha_2 \rightarrow 0
\end{aligned}$$

Substituting,

$$y'(x_0) = \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \rightarrow 0} (f'(u_0) + \alpha_2)(g'(x_0) + \alpha_1) = f'(u_0) \cdot g'(x_0)$$

### 3 Fermat Theorem

Let  $f(x)$  be defined on an open interval  $(a, b)$  and differentiable at  $x_0 \in (a, b)$ . If  $f(x)$  has its extremum at  $x_0$ , then,  $f'(x_0) = 0$

#### 3.1 Proof

Assume that  $f(x_0)$  is the maximum value of  $f(x)$  on  $(a, b)$ . Then,  $\forall \Delta x, f(x_0 + \Delta x) \leq f(x_0)$ .

**Case I:**  $\Delta x > 0$

$$\begin{aligned}
&\frac{f(x_0 + \Delta x) - f(x_0)}{\Delta x} \leq 0 \\
\therefore \text{RHD} &= \lim_{\Delta x \rightarrow 0^+} \frac{f(x_0 + \Delta x) - f(x_0)}{\Delta x} \leq 0
\end{aligned}$$

**Case II:**  $\Delta x < 0$

$$\begin{aligned}
&\frac{f(x_0 + \Delta x) - f(x_0)}{\Delta x} \geq 0 \\
\therefore \text{LHD} &= \lim_{\Delta x \rightarrow 0^-} \frac{f(x_0 + \Delta x) - f(x_0)}{\Delta x} \geq 0
\end{aligned}$$

$$\exists f'(x_0) \Rightarrow \text{LHD} = \text{RHD}$$

$$\therefore 0 \leq f'(x_0) \leq 0$$

$$\therefore f'(x_0) = 0$$

## 4 Rolle Theorem

Let  $f(x)$  be defined on  $[a, b]$ , s.t.

- (1)  $f$  is continuous on  $[a, b]$
- (2)  $f$  is differentiable on  $(a, b)$
- (3)  $f(a) = f(b)$

Then,  $\exists c \in (a, b)$ , s.t.  $f'(c) = 0$ .

### 4.1 Proof

By Weirstrauss Theorem, as  $f(x)$  is continuous on  $[a, b]$ ,  $f(x)$  has its maximum  $M$  and minimum  $m$  on  $[a, b]$ .

**Case I:**  $m = M$

$$\begin{aligned} f(x) &= \text{constant} \\ \therefore f'(x) &= 0 \text{ on } [a, b] \end{aligned}$$

**Case II:**  $m < M$

Atleast one of  $m$  and  $M$  must be in  $(a, b)$ , otherwise  $f(a) \neq f(b)$ , which contradicts (3).

Let  $M = c \in (a, b)$ . Therefore, by Theorem 3,  $f'(c) = 0$

## 5 Lagrange Theorem

Let  $f(x)$  be defined on  $[a, b]$ , s.t.

- (1)  $f$  is continuous on  $[a, b]$
- (2)  $f$  is differentiable on  $(a, b)$

Then,  $\exists c \in (a, b)$ , s.t.  $f'(c) = \frac{f(b) - f(a)}{b - a}$

## 6 Theorem

Let  $f(x)$  be continuous on  $(x_0 - \delta, x_0 + \delta)$  and differentiable on  $(x_0 - \delta, x_0) \cup (x_0, x_0 + \delta)$ .

If  $\lim_{x \rightarrow x_0^+} f'(x) = \lim_{x \rightarrow x_0^-} f'(x) = L$ , then,  $\exists f'(x_0) = L$ .
